

Steam ROM Manager Setup

Dolphin NetPlay Launcher

This guide creates a separate **Dolphin Netplay** collection in Steam. Those Steam entries launch Dolphin NetPlay Launcher with the selected game path instead of launching the game directly in Dolphin.

Before you start: You should already have a working Dolphin GameCube and/or Wii parser in Steam ROM Manager. The easiest method is usually to **clone your existing Dolphin parser** and modify the clone.

What you will change

1	ROMs Directory	Point at the parent folder containing both your GameCube and Wii ROM folders.
2	Steam Collections	Use "Dolphin Netplay".
3	Search Glob	Match both GameCube and Wii subfolders while keeping the normal Dolphin file extensions.
4	Executable	Select DolphinNetPlayLauncher.exe.
5	Arguments	Use exactly "\${filePath}" so the launcher receives the selected ROM path.
6	Title Modifier	Append " Netplay" to \${fuzzyTitle}.
7	Finish	Save, parse, exclude games you do not want for NetPlay, then save the app list to Steam.

The screenshots use **gc** and **wii** as the ROM subfolder names. Use the actual folder names on your system.

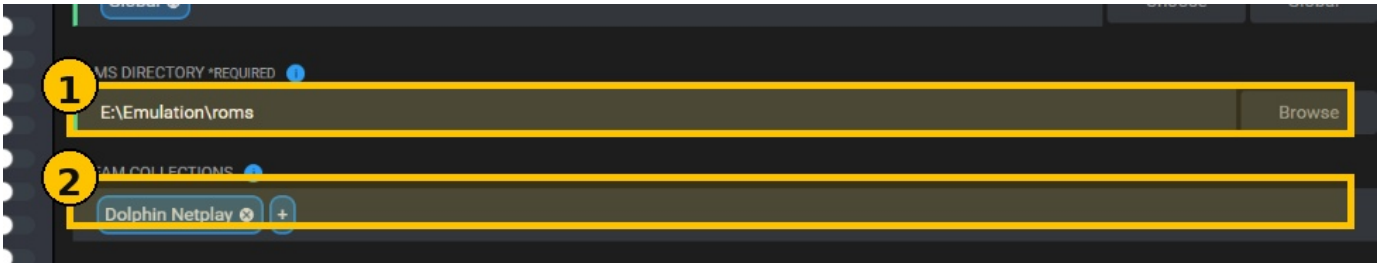

TL;DR - Already comfortable with Steam ROM Manager?

Clone your working Dolphin parser. Point **ROMs Directory** at the parent folder containing both your GC and Wii folders; change the glob so it searches both; set **Steam Collections** to **Dolphin Netplay**; set **Executable** to **DolphinNetPlayLauncher.exe**; set arguments to **"\${filePath}"**; and change **Title Modifier** to **\${fuzzyTitle} Netplay**. Save, parse, exclude games you do not want for NetPlay, then save the app list to Steam.

1. Create or clone the parser

In Steam ROM Manager, either create a new **Glob** parser or clone your existing Dolphin GameCube/Wii parser. Cloning is recommended because it preserves the file-extension list and other settings that already work with your ROM library.

2. Point the parser at the shared ROM parent folder

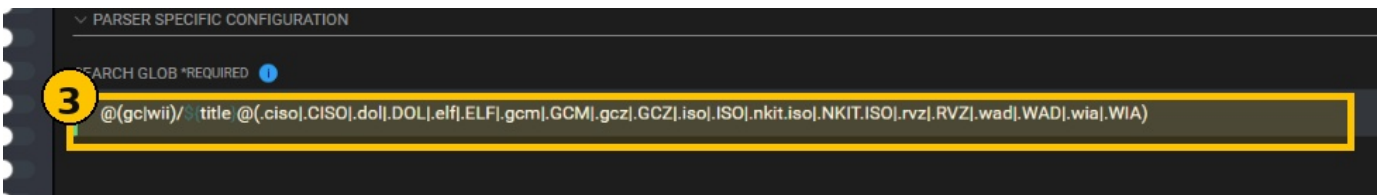

1 - ROMs Directory: Do not point this NetPlay parser only at the GameCube folder or only at the Wii folder. Point it one level higher, at the parent folder that contains both.

Example:

```
E:\Emulation\roms\  
  gc\  
  wii\
```

2 - Steam Collections: Set the collection name to **Dolphin Netplay**. This keeps the NetPlay shortcuts separate from your normal Dolphin shortcuts in Steam.

3. Configure the Search Glob

3 - Search Glob: Keep the normal Dolphin-compatible file extensions from your existing parser, but make the path portion match **both** ROM subfolders.

For folders named **gc** and **wii**, the beginning should follow this pattern:

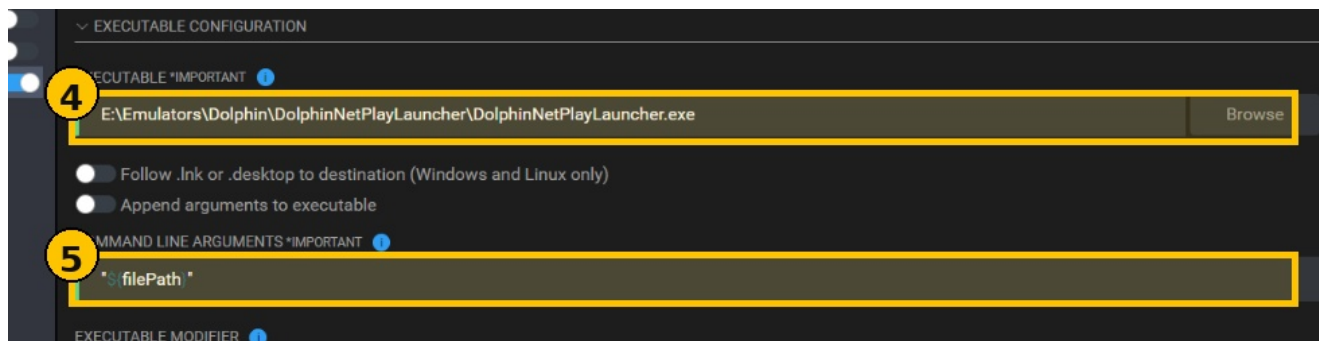

```
@(gc|wii)/...
```

Copy/paste example: If your folders are literally named **gc** and **wii**, you can use the same glob shown in this guide:

```
@(gc|wii)/${title}@(.ciso|.CISO|.dol|.DOL|.elf|.ELF|.gcm|.GCM|  
.gcZ|.GCZ|.iso|.ISO|.nkit.iso|.NKIT.ISO|.rvz|.RVZ|.wad|.WAD|.wia|.WIA)
```

If your folders use different names, replace **gc** and **wii** inside the first **@(...)**. You can also add or remove file extensions to match your own Dolphin library.

4. Point the parser at Dolphin NetPlay Launcher

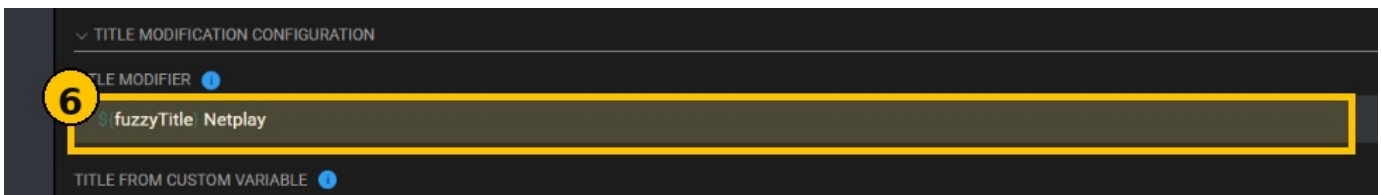

4 - Executable: Browse to and select **DolphinNetPlayLauncher.exe**.

5 - Command Line Arguments: Use exactly:

```
"${filePath}"
```

Do **not** include Dolphin's normal **-e** argument. Steam ROM Manager should pass the selected ROM path directly to Dolphin NetPlay Launcher.

5. Make the Steam titles clearly identify NetPlay

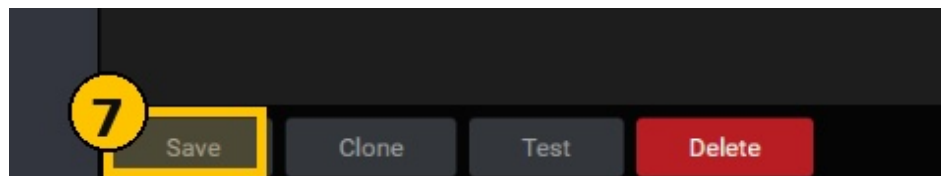

6 - Title Modification Configuration > Title Modifier: append **Netplay** to the fuzzy title.

```
${fuzzyTitle} Netplay
```

This makes the generated Steam entry easy to distinguish from the normal Dolphin entry - for example, **Mario Party 7 Netplay** instead of simply **Mario Party 7**.

6. Save and parse

7 - **Save**: Save the parser, then begin parsing your ROM library.

After parsing, review the generated games and **exclude titles you do not want in the NetPlay collection**. For most libraries this means removing single-player games or anything you know you will never use for multiplayer.

When the list looks right, use Steam ROM Manager's normal option to **save the app list to Steam**. Restart Steam if Steam ROM Manager instructs you to do so.

Result: Steam should now contain a separate **Dolphin Netplay** collection. Launching one of those entries passes that game's ROM path to Dolphin NetPlay Launcher, where you can choose Host or Join.

Important: joining a NetPlay session does not require the selected game to be used locally. The host determines the game for the session; the Steam-selected game is primarily relevant when hosting.
